

Oliver Peters Color Presets.- Final Cut Pro X 10.4 or later

Custom Color Effects presets are now located in the Effects Presets folder within the user Library of your Mac and not the Color Presets folder. Existing custom Color Board presets located in the Color Presets folder are supposed to be “promoted” to Effects Presets when you upgrade Final Cut Pro X to version 10.4. However, I have found that it worked correctly under macOS 10.12.x (Sierra), but not 10.13.x (High Sierra).

If you have previously downloaded and installed my Color Board presets and these did not get promoted to Effects Presets - or you have installed Final Cut Pro X 10.4 for the first time - simply copy the 40 OP presets from enclosed folder into your Effects Presets folder. You can access this folder by holding the Option key and then clicking on Go on your macOS top menu. This makes the user Library visible in the Go pulldown menu. The Effects Presets folder path is user Library/Application Support/ProApps/Effects Presets.

Once correctly installed or promoted, these presets will appear in the FCPX interface's Effects Browser in the Color Presets section. This will enable you to skim over the thumbnails to preview the look as it would appear when applied to your footage. These presets apply Color Board settings and can easily be adjusted through the Color Board controls, once you've applied them to a clip.

These effects presets are made available at no charge without any restriction of their use. No warranty is offered or implied. Use at your own risk.
